Preventative Maintenance Service with 99 Day Remote Backup

Here's a few reasons why your computer becomes slower over time:

- 1. Dirt, dust and debris...**through time, the inside of the computer case become clogged with dirt and dust. This decreases the airway to properly cool the computer's electronics. The lack of airflow results in an increase in heat which can lead to slower processing time and hardware failure.
- 2. A long list of old records...**When new software and devices are installing and regular activities such as Internet surfing and word processing are performing, the computer's operating system keeps records of all these events. Over time, these records become outdated and inaccurate. As a result of these faulty records, the computer has to search for the most updated record, which causes performance to suffer.
- 3. Startup trouble...**many unnecessary programs are set to start automatically every time you turn your computer on. These programs are wasting the computer's calculating power and resources. This bottleneck causes two problems: First, a slower starting computer. Second, a slower operating computer.
- 4. Clutter and chaos...**computers also slow down over time due to an increase of files stored on the hard drive. Some of these files are old system logs that are needlessly consuming memory and taking up drive space. This results in fragmentation, or an unorganized hard drive, that causes slow access speeds for files and programs.
- 5. Unsafe software...**even with the cleanest airways and maintained hard drive, computers slow down due to unauthorized programs such as viruses and spyware stealing the computer's processing resources from you.

For just \$1 a day, keep your computer running fast and your files safe.

In case of a devastating event such as a fire, flood, theft, software corruption or hardware failure, the remote backup will restore all your important files, pictures, music and more.

Have peace of mind...Enjoy your computer experience!
